Occupancy Analysis Report

Collection ID AH-2026-1112-LHR-CUBITT
Asset Cubitt Wharf Residences / Tower Hamlets (or nearest named multifamily)
Sensor WorldView-3 31 cm PAN off-nadir 18.4 deg
Tiles 4 nadir loops ´• 20-24 s ´• VLM hawk-v11n

1. Purpose
Occupancy underpins real-estate value. If a multifamily cannot be filled with tenants, the rent roll is not an income stream - it is a claim. Asset Hawk lets an investor underwrite that claim from orbit before requesting a single seller document.

2. Method
Dwellings are stable house footprints. Vehicles are COCO car detections, median-smoothed across the loop. A dwelling is occupied if at least one parked car sits within ~18 m of its footprint. Through-traffic (displacement > 4 m/s) is excluded. People are counted but not used in the occupancy proxy.

3. Observed (regional roll-up)
Dwellings counted 48
Parked cars (median) 34
Cars per dwelling 0.71
Occupied (car-at-kerb) 34 / 48
Observed occupancy 71-75% (point 73%)
Seller claimed occupancy 95%
Gap -22 percentage points

4. Tile breakdown
Z-N North courtyard occ 75% cars 9 houses 12
Z-E East street grid occ 83% cars 11 houses 12
Z-W West terrace occ 67% cars 7 houses 12
Z-S South car park occ 71% cars 8 houses 12

5. Interpretation
The west and south tiles drive the miss. Pattern is consistent with empty units rather than a single-day event: parked-car counts are stable across the loops. Night-time and weekend revisits recommended before IC.

6. Confidence
This is a physical-occupancy proxy, not a tenancy legal conclusion. Company cars, residents without cars, and underground parking can bias the ratio. Even with those caveats, a 20pt+ gap versus a 95% rent roll is material and should be treated as an overstatement until proven otherwise.
